

Radiology Report (Dummy)

Patient ID: 12345
Name: John Doe
Date of Birth: 1970-01-01
Date of Exam: 2025-09-01
Exam Type: CT Chest (with contrast)

Clinical Indication

History of chronic cough, smoker with 30 pack-year history. Evaluate for possible pulmonary nodules or masses.

Technique

Axial CT images of the chest were obtained with intravenous contrast. Coronal and sagittal reconstructions performed.

Findings

- Lungs: No focal consolidation. A 4 mm well-circumscribed non-calcified pulmonary nodule is noted in the right upper lobe. No evidence of cavitation or pleural effusion.
- Mediastinum: Normal-sized heart and mediastinal contours. No significant lymphadenopathy.
- Pleura: No pleural thickening or effusion.
- Bones: No acute osseous abnormality.
- Upper Abdomen (limited view): Normal liver and adrenal contours.

Impression

1. Small right upper lobe pulmonary nodule (4 mm). Recommend follow-up CT in 12 months to assess for stability (per Fleischner Society guidelines for incidental pulmonary nodules).
2. No acute cardiopulmonary abnormalities.
